

IN THE CLAIMS:

The current claims follow. For claims not marked as amended in this response, any difference in the claims below and the previous state of the claims is unintentional and in the nature of a typographical error.

1. (Previously Presented) A switched input video device comprising:
a switched input
at least one of video improvement circuitry and transcoder circuitry; and
a switch for communicating the switched input to at least one of the video improvement circuitry and the transcoder circuitry, wherein the switch is operable to sense a presence of a signal on the switched input and communicate the switched input to the at least one of the video improvement circuitry and the transcoder circuitry in response to the sensed signal.

2. (Previously Presented) The switched input video device as recited in claim 1, further comprising an internal media player and wherein the switch selects either the Internal medial player or the switched Input

3. (Previously Presented) The switched input video device as recited in claim 1, wherein the switch is externally controlled.

4. (Previously Presented) The switched input video device as recited in claim 1, wherein the switch is remotely controlled.

5. (Canceled)

6. (Previously Presented) A method for improving video, the method comprising:
receiving a video signal that complies with a standard;
sensing one or more blanking portions of the video signal; and
altering the video signal during a portion of the video signal other than the one or more blanking portions, wherein the altered portion of the video signal does not comply with the standard and the alterations improve a characteristic of the video signal.

7. (Previously Presented) The method of Claim 6, wherein altering the video signal comprises increasing a portion of the video signal at 0.7 volts above a baseline to a level higher than 0.7 volts above the baseline.

8. (Previously Presented) The method of Claim 6, wherein altering the video signal comprises setting a black portion of the video signal below a baseline.

9. (Previously Presented) The method of Claim 6, wherein altering the video signal comprises setting a black start at approximately 10% to approximately 12% below base line for component RGB video.

10. (Previously Presented) The method of Claim 9, wherein altering the video signal further comprises setting a white stop between approximately 1 volt and approximately 2 volts above the baseline.

11. (Previously Presented) The method of Claim 10, wherein altering the video signal further comprises retiming the video signal.

12. (Previously Presented) The method of Claim 6, wherein altering the video signal comprises increasing an IRE upper expanded range.

13. (Previously Presented) The method of Claim 6, wherein altering the video signal comprises processing the video signal with a plurality of noise removal diodes and a filter having a bell shaped bandpass characteristic.

14. (Previously Presented) The method of Claim 13, wherein the noise removal diodes are shunted with a circuit having variable resistance.

15 19. (Currently Amended) The method of Claim 6, wherein video equipment performing the method can accommodate a signal with transitions having a maximum slope, and wherein altering the video signal comprises increasing a slope of a portion of the video signal to a slope not exceeding the maximum slope.

16 20. (Currently Amended) The method of Claim 15 19, wherein altering the video signal comprises adding frequency components to the video signal that are higher than permitted in the standard.

17 21. (Currently Amended) A video improvement circuit, comprising:

- a first circuit for sensing one or more blanking portions of an input video signal that complies with a standard;
- a second circuit for altering a chroma portion of the input video signal;
- a third circuit for altering a contrast of a luma portion of the input video signal;
- [[an]] a fourth circuit for altering high frequency portions of the altered luma portion from the third circuit;
- a fifth circuit for combining the altered chroma portion from the second circuit, the altered luma portion from the third circuit, and the altered luma portion from the fourth circuit to produce an output video signal, wherein the output video signal does not comply with the standard,

wherein the second circuit, third circuit, and fourth circuit, in response to the first circuit, alter the video signal only during a portion of the video signal other than the one or more blanking portions.

18 ~~22~~. (Currently Amended) The video improvement circuit of Claim 17 ~~24~~, wherein the third circuit sets a black start below a baseline of the standard.

19 ~~23~~. (Currently Amended) The video improvement circuit of Claim 18 ~~22~~, wherein the third circuit sets a white stop above a white stop of the standard.

20 ~~24~~. (Currently Amended) The video improvement circuit of Claim 17 ~~24~~, wherein the third circuit increases an IRE upper expanded range of the video signal.

21 ~~25~~. (Currently Amended) The video improvement circuit of Claim 17 ~~24~~, wherein the fourth circuit further removes noise from the altered luma portion.

22 ~~26~~. (Currently Amended) The video improvement circuit of Claim 21 ~~25~~, wherein the fourth circuit comprises a plurality of noise removal diodes and a filter having a bell shaped bandpass characteristic.

23 27. (Currently Amended) The video improvement circuit of Claim 17 24, wherein the noise removal diodes are shunted with a circuit having variable resistance.

24 28. (Currently Amended) The video improvement circuit of Claim 17 26, adapted for use in a video device having circuitry that can accommodate a signal with transitions having a maximum slope, wherein one or more of the second circuit, third circuit, and fourth circuit is adapted to increase a slope of a portion of the video signal to a slope not exceeding the maximum slope.
